

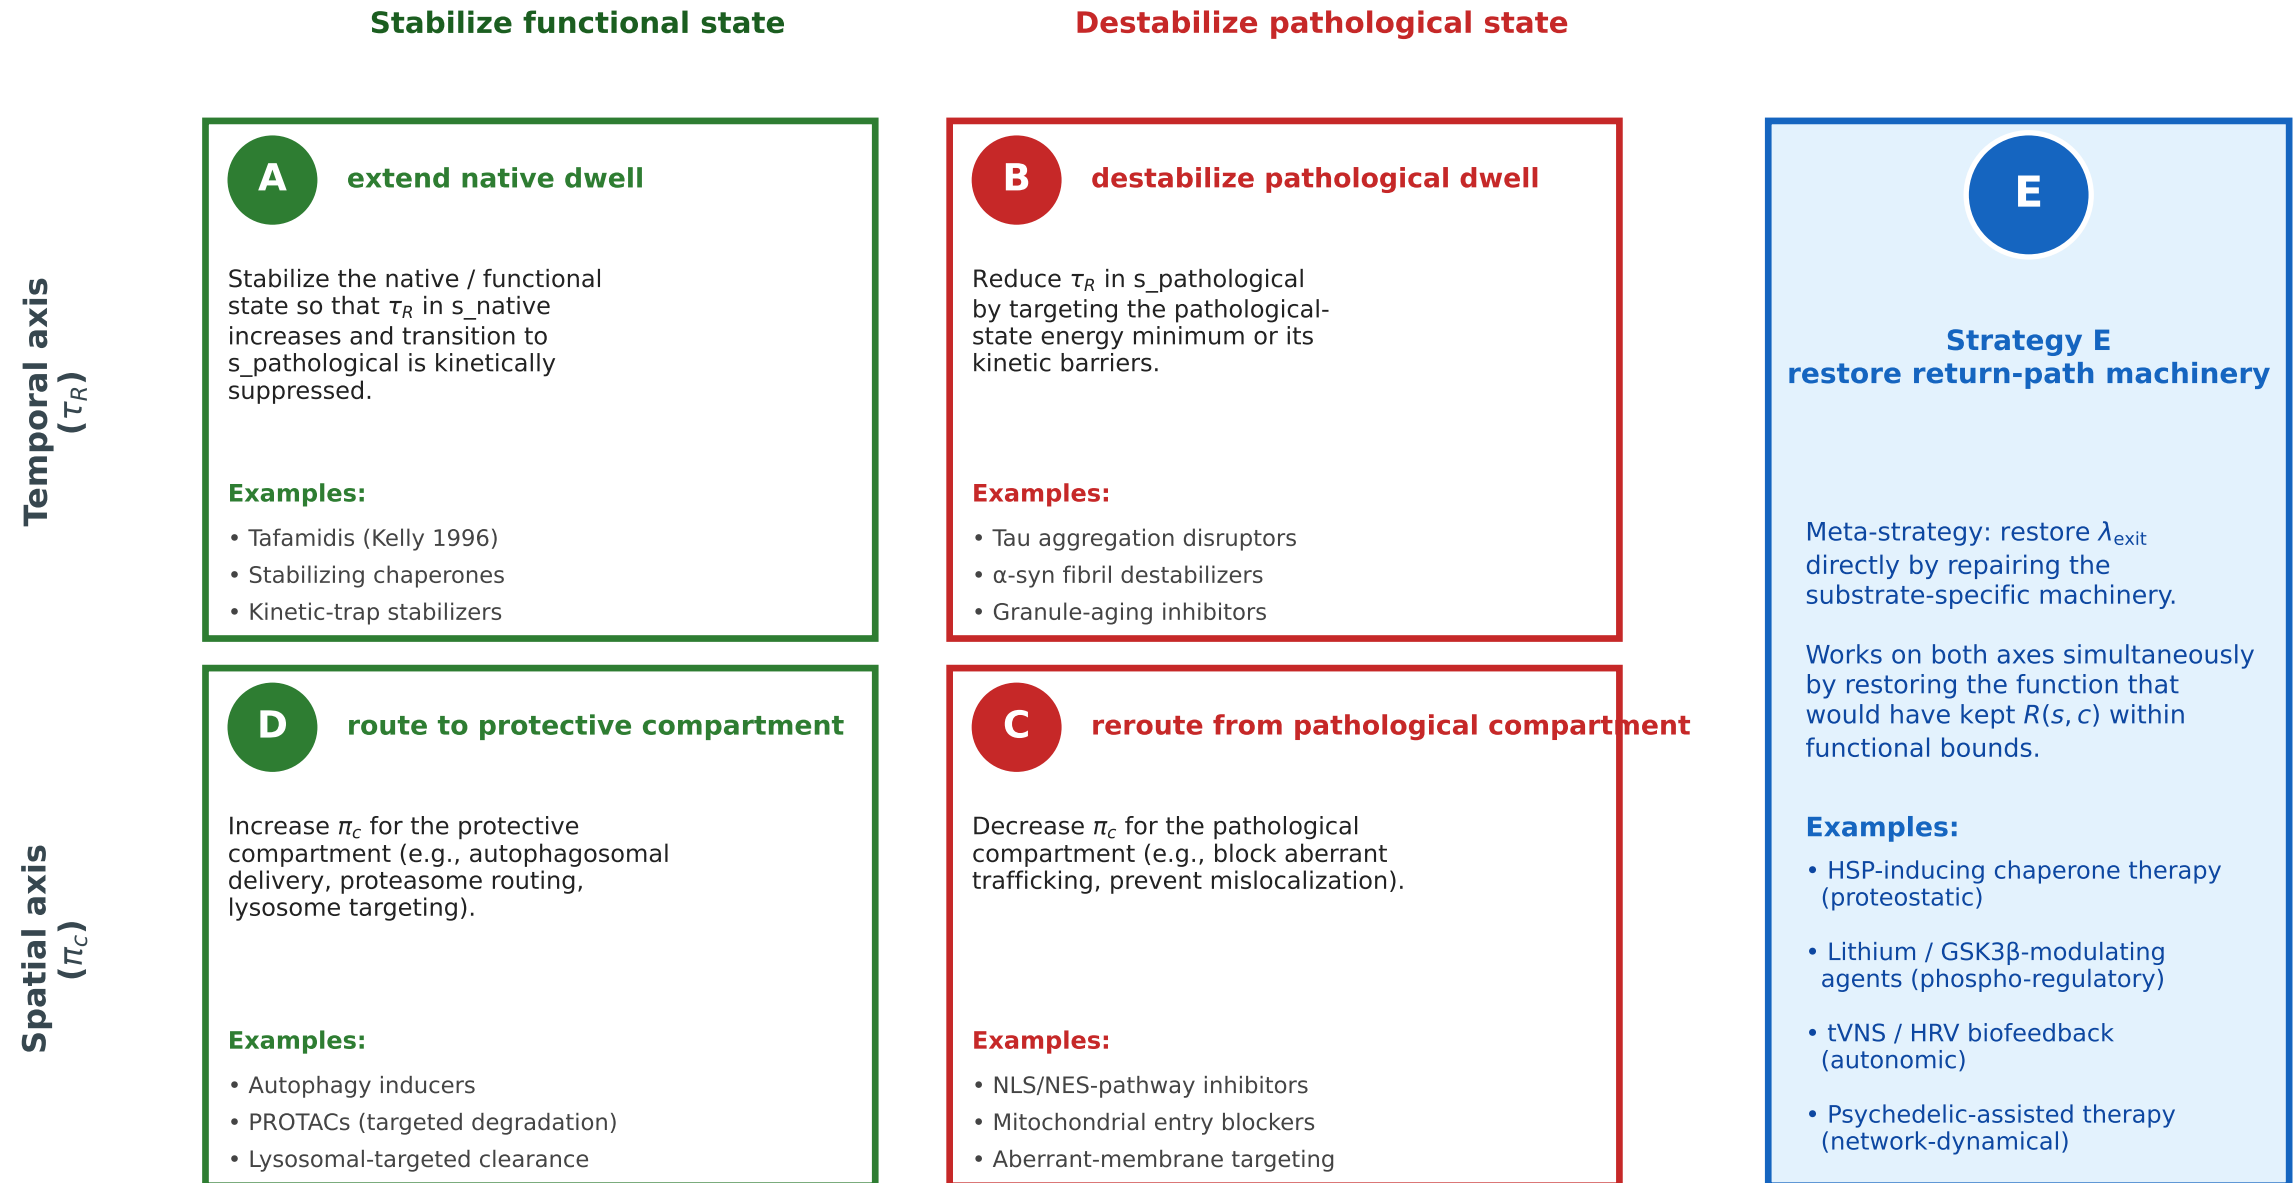

Figure 4. Symmetric kinetic-stabilization strategies (§5)

Five strategies for residence control across both axes; Strategy E restores the return-path machinery directly.

The five strategies are symmetric across the two axes and across the stabilize/destabilize direction; strategy E acts on λ_{exit} directly. Kelly's 1996 transthyretin work (Strategy A) is the canonical published precedent; Strategies B–E are symmetric extensions developed in §5 as the molecular substrate's incremental contribution to the framework.
